ABSTRACT:

PROBLEM TO BE SOLVED: To obtain a steel product excellent in scratch resistance in the case where sliding or coiling working is applied, adhesion of plating, and corrosion resistance in a worked part by specifying the composition and structure of a Zn-Al-Mg plating layer, respectively.

SOLUTION: The steel product has, on its surface, a plating layer having a composition consisting of, by weight, 0.1-40% Al, 0.1-10% Mg, and the balance Zn and also having a structure where an Mg-type intermetallic compound phase of
